

Student interview questions :

1. **How do you think jobs in the computer science field may be affected by the larger presence of AI?**

I think AI will change what computer science jobs will look like in the future. Low-skill or repetitive jobs may be automated with AI, but there will be more demand for jobs related to AI development and integration.

2. **Is the field of AI opening more job and career opportunities in your field, or is it shrinking the job field?**

We see a lot of job openings related to developing and managing AI, and demand has been increasing. However, these companies want engineers who can use AI tools, so they are expecting to hire experienced people rather than recent graduates. Overall, I think we will experience fewer entry-level jobs but more opportunities in the senior-level, making it more competitive for younger generations like us.

3. **Are you seeing a shift in what humans need to do and what AI can now do? Or do you think AI will not be able to complete the same jobs as humans?**

Yes definitely. As mentioned before, low-skill or repetitive jobs may be automated with AI. Our job, as humans, will most likely shift towards managing the AI, so it will be accurate and safe. There are definitely limits to what AI can do, such as solving an unexpected problem that we have never seen before.

4. **What trends are you concerned about or excited about in the field, and how does this affect job prospects?**

I am concerned about the shifting of the computer science jobs, specifically the decrease in the demand for entry-level jobs. It is very competitive right now and it is really important to build a good resume with internships and personal projects.

5. **Is it true that AI is making students in CS develop stronger critical thinking skills?**

I would say it's the opposite, and it goes for not only CS students but in general. AI is so advanced now that for most of the basic school work, AI can guide you through it. A recent trend we have in CS is what we call "vibe coding". It is a term used for when you used an AI to write the basic code and you edit/add to meet your needs.

6. **What is your track in CS, what do you plan to do with CS when you graduate, and do you think AI will be beneficial in your real-world job?**

My track for CS is software engineering. My plan for after graduation is to find a job hopefully in FAANG (Facebook, Apple, Amazon, Netflix, Google), as a software engineer. AI will definitely play a huge role in my job, since many companies are starting to integrate it for everything. I am actually working for a startup company right now to help develop an app and integrate AI to generate a custom lifting plans for athletes. It's been really cool to get hands-on experience with AI, and I'm impressed by how fast it's evolving!
